Real Case Example

Request for advice

On March 15, 2024, a 68-year-old woman presented with a growing scalp lesion that had developed over the past year. With no previous skin issues, the doctor was unsure if it was an epidermal nevus, nevus sebaceous, or seborrheic keratosis, and questioned the need for a biopsy.

Reply from Dermatologist in 24 hr

Three days later Dr. Jim Muir, a dermatologist, responded. He suggested that if the lesion was new and enlarging, seborrheic keratosis was likely. If present since childhood, an epidermal nevus was possible, and a biopsy would be recommended to clarify. A shave biopsy was advised to resolve the uncertainty.

- If you have any questions about Tele-Derm or any of ACRRM's digital health programs, please don't hesitate to email us at ehealth@acrrm.org.au

- ACRRM has also opened the expression of interest for the upcoming ACRRM Telehealth Clinical Skills Program. More information can be found here: <https://www.acrrm.org.au/resources/digital-health/telehealth>
